

Why solar modules

Solar modules form the heart of every photovoltaic plant and are responsible for the generation of power.

A photovoltaic- or solar module transforms the sunlight directly into electricity. As most important component it contains several solar cells, which form a solar module in combination with different connecting material.

We offer the following kinds of solar modules:

- **First Solar thin-film module technology**
- **Nanosolar thin-film module technology**
- **CSG Module technology**
- **Poly-/Monocrystalline cells**
- **Amorphous solar cells**

For any questions for our used solar modules feel free to **contact** us.
